

Accessibility Questions

Emily Parks

1. What corrections did you have to make, and how did you make them?

-I needed to identify the language of the page. I did this by adding lang='en' in the HTML tag.

-I had to add alternate text to the images on the site. I did this by adding alt='//image description//' to the images.

-I needed to add a label to the search input section. I did this by adding *aria-label*="search" to the section.

2. Is this interface functional without the use of a mouse (i.e., just using keyboard keys)? Why or why not?

It is mostly functional. You can access the search bar and use it. You can also use the tab key to get to the different links on the page.

3. What are other accessibility tests or features you added or would be interested in learning about?

I feel I learned a lot about accessibility and the Wave add-on really helps. I can't think of any others I would be interested in learning more about.
